- 3 The Prototype System
- 4 Example
- 5 Next Steps

# Who am I?

Slide 3 of 22

## Dan Szymczak

Introduction

Research

Prototype

Example

Next Steps

- Ph.D. Software Engineering
  - Currently in progress. Started Autumn 2014.
- M.A.Sc. Software Engineering
  - McMaster University 2014
  - Thesis – *Generating Learning Algorithms: Hidden Markov Models as a Case Study*
- B.Eng Software (Game Design)
  - McMaster University 2011

# Current Program Progress

Slide 5 of 22

Introduction

Research

Prototype

Example

Next Steps

- Completed 3/4 necessary graduate courses
- Completed part one of comprehensive exam
- Research and prototype system development are underway

# Research

## Key Problem(s)

### How can we

- improve the reuse of mathematical, scientific, and engineering knowledge?
- handle knowledge duplication across software artifacts?
- improve the qualities of traceability, maintainability, verifiability and (re)usability?

# Research

## Musings

Introduction

Research

Prototype

Example

Next Steps

How can we improve the reuse of mathematical, scientific, and engineering knowledge?

- Simplify the knowledge store
- Create a means of obtaining knowledge relevant to a project
- Make it accessible

# Research

## Musings Cont'd

Introduction

Research

Prototype

Example

Next Steps

Why is the duplication problem not solved yet?

- Existing tools and abstraction features only go so far
- Knowledge is shared across languages/artifacts/views
- No standard method for encoding knowledge or reusing it

# Research

## Musings Cont'd

Introduction

Research

Prototype

Example

Next Steps

Are these problems specific to math software?

# No

# Research

## Solution Plan

Introduction

Research

Prototype

Example

Next Steps

- Focus: avoid knowledge duplication across artifacts through reuse
- Maintain: clear traceability between artifacts
- Utilize: generative programming to create artifacts from captured knowledge
- Expand: ideas from literate programming

# Research

## Solution Plan Cont'd

Introduction

Research

Prototype

Example

Next Steps

- Create: a domain-specific language for both knowledge capture & the artifact generator
- Implement: a feature for creating program families
- Test: apply the tool to real world problems in scientific computing

# Prototype

## Design and Development

- Taking a practical approach
- Focusing on knowledge reuse, as opposed to the formal nature of the knowledge itself

# Prototype

## How?

Introduction

Research

**Prototype**

Example

Next Steps

## A practical approach

- Use existing artifacts as knowledge sources
- Motivated by concrete examples
- Avoid overdesigning and underdeveloping

## Example: $h_g$

A simple example taken from the SRS for FP

$h_g$  is a symbol which appears in several locations including:

- The Software Requirements Specification (SRS)
- The Literate Programmer's Manual (LPM)
- The Source Code

Let's take a look!

## Example: $h_g$

SRS Definition for  $h_g$  (original)

Number	DD1
Label	$h_g$
Units	$ML^0 t^{-3} T^{-1}$
SI	$\frac{\text{kW}}{\text{m}^2(^{\circ}\text{C})}$
Equation	$h_g = \frac{2k_c h_p}{2k_c + \tau_c h_p}$
Description	<p><math>h_g</math> is the gap conductance</p> <p><math>\tau_c</math> is the clad thickness</p> <p><math>h_p</math> is initial gap film conductance</p> <p><math>k_c</math> is the clad conductivity</p> <p>NOTE: Equation taken from the code</p>
Sources	source code

## Example: $h_g$ LPM Definition for $h_g$ (original)

$$h_g = \frac{2k_c h_p}{2k_c + \tau_c h_p} \quad (1)$$

The corresponding C code is given by:

```
double calc_hg(double k_c, double h_b, double tau_c)
{
    return (2*(k_c)*(h_p)) / ((2*(k_c)) + (tau_c*(h_p)));
}
```

## Example: $h_g$

A simple example taken from the SRS for FP

Modifying  $h_g$  to reflect changes in requirements is not simple. It involves the following steps:

- Update the definition in the SRS, LPM, etc.
- Modify the source code
- Trace all dependencies
- Modify dependents
- Ensure each artifact is now up to date and consistent

# Example: $h_g$

Simplifying the process

Introduction

Research

Prototype

Example

Next Steps

Here is an example of a “chunk” for  $h_g$ :

```

-----
{----- Begin h_g -----}
-----

h_g :: Chunk
h_g = newChunk $
  [(Symbol, S "h" :-: S "g"),
   (Equation, E h_g_eq),
   (SIU, S "($\\mathrm{\\frac{kW}{m^2C}})$"),
   (Description, S
    "effective heat transfer coefficient between clad and fuel surface")
  ]

h_g_dep :: Dependency
h_g_dep = get_dep h_g_eq

h_g_eq :: Expr
h_g_eq = ((Int 2):(C k_c):(C h_p)) :/ ((Int 2):(C k_c):+(C tau_c):(C h_p))

```

## Example: $h_g$

How do we generate?

What do we do with the “chunk”?  
That depends on the “recipe”!

- To create our SRS we use the following recipe:

```
createSRS :: Doc
createSRS = spre $$ doctitle $$
              author auth $$ srsComms $$
              begin $$ srsBody $$ end
```

- To create our LPM we use the following recipe:

```
createLPM :: Doc
createLPM = lpre $$ doctitle $$
              author auth $$ lpmComms $$
              begin $$ lpmBody $$ endL
```

## Example: $h_g$

Generated SRS Output

Number	DD2
Label	$h_g$
Units	$ML^0 t^{-3} T^{-1}$
SI	$\frac{\text{kW}}{\text{m}^2 \text{ } ^\circ\text{C}}$
Equation	$h_g = \frac{2k_c h_p}{2k_c + \tau_c h_p}$
Description	<p><math>h_g</math> is the effective heat transfer coefficient between clad and fuel surface</p> <p><math>k_c</math> is the clad conductivity</p> <p><math>h_p</math> is the initial gap film conductance</p> <p><math>\tau_c</math> is the clad thickness</p> <p>NOTE: Equation taken from the code</p>
Sources	source code

## Example: $h_g$ Generated LPM Output

$$h_g = \frac{2k_c h_p}{2k_c + \tau_c h_p} \quad (2)$$

The corresponding C code is given by:

```
double calc_h_g(double k_c, double h_p, double tau_c)
{
    return 2*k_c*h_p/(2*k_c+tau_c*h_p);
}
```

## Next Steps

The next 12 months

Introduction

Research

Prototype

Example

Next Steps

## What next?

- Comprehensive examination part two
- Complete final graduate level course
  - Looking for a category theory course, but open to suggestions
- Complete paper for SPLASH conference
- Complete SEHPCCSE conference paper
- Complete default “recipe” for each software artifact
- Have at least one large example working from the prototype
- Create the external language for using the prototype
- Communicate with industry regarding prototype and example(s)
