1 Symbols, Abbreviations and Acronyms

See SRS Documentation at https://jacquescarette.github.io/Drasil/examples/Projectile/srs/Projectile_SRS.pdf

2 Introduction

The following document details the Module Interface Specifications for the implemented modules in a program simulating projectile motion. It is intended to ease navigation through the program for design and maintenance purposes.

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at [No manual version of Projectile? Should this link be removed or should there be a link? —SC].

3 Notation

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003). The mathematical notation comes from Chapter 3 of Hoffman and Strooper (1995). For instance, the symbol $:=$ is used for a multiple assignment statement and conditional rules follow the form $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$.

The following table summarizes the primitive data types used by Projectile.

Data Type	Notation	Description
character	char	a single symbol or digit
real	\mathbb{R}	any number in $(-\infty, \infty)$

The specification of Projectile uses strings, a derived data type. Strings are lists of characters. In addition, Projectile uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

4 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2
Hardware-Hiding	
Behaviour-Hiding	Input Parameters Input Constraints Calculations Output Format Control Module Specification Parameters Module
Software Decision	Sequence Data Structure

Table 1: Module Hierarchy

5 MIS of Control Module

5.1 Module

main

5.2 Uses

Param (Section 6), InputConstraints (Section 7), Calculations (Section 8), output (Section 9)

5.3 Syntax

5.3.1 Exported Constants

filenameOut = “output”

5.3.2 Exported Access Programs

Name	In	Out	Exceptions
main	-	-	-

5.4 Semantics

5.4.1 State Variables

None

5.4.2 Access Routine Semantics

main():

- transition: Modify the state of Param module and the environment variables for the Output module by following these steps

```
Get (filenameIn: string) from user.  
load_params(filenameIn)  
input_constraints(Param)  
p_land := func_p_land(inParams)  
d_offset := func_d_offset(inParams, p_land)  
s := func_s(inParams, d_offset)  
#Output calculated values to a file.  
output(filenameOut,  $t_{\text{message}}$ ,  $t_{\text{output}}$ )
```

6 MIS of Input Parameters Module

The secrets of this module are the data structure for input parameters and how the values are inputted.

6.1 Module

Param

6.2 Uses

SpecParam (Section 10)

6.3 Syntax

Name	In	Out	Exceptions
load_params	string	-	FileError
v	-	\mathbb{R}	
θ	-	\mathbb{R}	
p_{target}	-	\mathbb{R}	

6.4 Semantics

6.4.1 Environment Variables

inputFile: sequence of string $\#f[i]$ is the i th string in the text file f

6.4.2 State Variables

To Support IM1 and IM2

$v: \mathbb{R}$

$\theta: \mathbb{R}$

To Support IM3 and IM4

$p_{\text{target}}: \mathbb{R}$

6.4.3 Assumptions

- load_params will be called before the values of any state variables will be accessed.
- The file contains the string equivalents of the numeric values for each input parameter in order, each on a new line. Any comments in the input file should be denoted with a '#' symbol.

6.4.4 Access Routine Semantics

Param. v :

- output: $out := v$
- exception: none

Param. θ :

- output: $out := \theta$
- exception: none

Param. p_{target} :

- output: $out := p_{\text{target}}$
- exception: none

load_params(s):

- transition: The filename s is first associated with the file f . The data from inputFile is read sequentially to populate the state variables from FR1 (v , θ , and p_{target}).
- exception: $\text{exc} :=$ a file name s cannot be found OR the format of inputFile is incorrect \Rightarrow FileNotFoundError

See Appendix (Section 12) for the complete list of exceptions and associated error messages.

6.5 Considerations

The value of each state variable can be accessed through its name (getter). An access program is available for each state variable. There are no setters for the state variables, since the values will be set by load_params and not changed for the life of the program.

7 MIS of Input Constraints Module

The secret of this module is how the values are verified.

7.1 Module

InputConstraints

7.2 Uses

Param (Section 6)

7.3 Syntax

7.3.1 Exported Access Programs

Name	In	Out	Exceptions
input_constraints	InputParameters	-	badVelocity, badAngle, badTargetPosition

7.4 Semantics

7.4.1 Assumptions

All of the fields Param have been assigned values before any of the access routines for this module are called.

7.4.2 Access Routine Semantics

input_constraints(inParams):

- out: *out* := none
- exception: exc := ($\neg(0 < \text{inParams}.v) \Rightarrow \text{badLength}$ |
 $\neg(0 < \text{inParams}.\theta < \frac{\pi}{2}) \Rightarrow \text{badAngle}$ |
 $\neg(0 < \text{inParams}.p_{\text{target}}) \Rightarrow \text{badTargetPosition}$)

7.5 Considerations

See Appendix (Section 12) for the complete list of exceptions and associated error messages.

8 MIS of Calculations Module

The secret of this module is how the required values are calculated.

8.1 Module

Calculations

8.2 Uses

Param (Section 6)

8.3 Syntax

8.3.1 Exported Access Programs

Name	In	Out	Exceptions
func_p_land	Params	\mathbb{R}	None
func_d_offset	Params, \mathbb{R}	\mathbb{R}	None
func_s	Params, \mathbb{R}	String	None

8.4 Semantics

8.4.1 Assumptions

All of the fields Param have been assigned values before any of the access routines for this module are called.

8.4.2 Access Routine Semantics

func_p_land(inParams):

- out: $out := \frac{2v^2 \sin(inParams.\theta) \cos(inParams.\theta)}{g}$
- exception: exc := none

func_d_offset(inParams):

- out: $out := p_{\text{land}} - p_{\text{target}}$
- exception: exc := none

func_s(inParams):

- out: $out := ($
 $|\frac{offset}{p_{target}}| < \epsilon \Rightarrow \text{“The target was hit.”} \mid$
 $offset < 0 \Rightarrow \text{“The projectile fell short.”} \mid$
 $True \Rightarrow \text{“The projectile went long.”})$
- exception: $exc := none$

8.5 Considerations

See Appendix (Section [12](#)) for the complete list of exceptions and associated error messages.

9 MIS of Output Module

9.1 Module

output

9.2 Uses

Param (Section 6)

9.3 Syntax

9.3.1 Exported Access Program

Name	In	Out	Exceptions
output	fname: string, message : \mathbb{R} , offset : \mathbb{R}	-	-

9.4 Semantics

9.4.1 State Variables

None

9.4.2 Environment Variables

file: A text file

9.4.3 Access Routine Semantics

output(fname, message, offset):

- transition: Write to environment variable named fname the calculated values message and offset.
- exception: none

10 MIS of Specification Parameters

The secrets of this module is the value of the specification parameters.

10.1 Module

SpecParam

10.2 Uses

N/A

10.3 Syntax

10.3.1 Exported Constants

From Table 10 in SRS

$g := 9.8$

$\epsilon := 0.02$

10.4 Semantics

N/A

12 Appendix

Message ID	Error Message
badVelocity	InputError: Velocity must be positive.
badAngle	InputError: Angle must be between zero and pi over two radians.
badTargetPosition	InputError: Target position must be positive.

Table 2: Possible Exceptions
